

Rapid 7 is a vulnerability management tool that lets users assess any potential vulnerabilities in a system. Rapid 7 scans devices to find various loopholes that can be exploited by attackers. Not only does Rapid 7 showcase visibility into vulnerabilities in the IT environment and remote endpoints but also give a detailed explanation as to what are the business risks involved. Rapid 7's vulnerability tool InsightVM, is also user friendly where new users can adapt to the tool with ease.

InsightVM's key features include:

- **Automatic containment**  
InsightVM has automatic containment of vulnerabilities, and assesses key risks that face the IT environment.
- **Understand and prioritize risks**  
The tool also has the ability to understand the risks involved and prioritize them accordingly from high importance to low importance.
- **Remediate with impact and influence**  
Security teams can assign and track remediation duties in real time, providing continuous visibility into how well issues are being fixed.
- **Lightweight endpoint engine which automatically collects data from endpoints**  
Insight Agent automatically collects data from all your endpoints, even those from remote workers and sensitive assets that cannot be actively scanned, or that rarely join the corporate network.
- **Live dashboards**  
InsightVM Live Dashboards are live and interactive by nature. You can easily create custom cards and full dashboards for anyone—from system admins to CISOs—and query each card with simple language to track the progress of your security program.
- **Integrated threat feeds**  
InsightVM's dynamic view shows you the threats that are most relevant to your environment, enabling you to better protect against current, impending threats and react quickly to critical, named vulnerabilities.

- **Easy to use application**

InsightVM's RESTful API makes it simple to accomplish more within your unique security program. It was built to easily automate virtually any aspect of vulnerability management, from data collection to risk analysis, and integrate InsightVM capabilities with your other processes.

- **Policy assessment**

Custom Policy Builder allows you to modify existing benchmarks or create new policies from scratch to meet the needs of your unique operating environment.

**Integration Includes:**

- SIEM
- Patch management
- Ticketing system
- Cloud and virtual infrastructure
- Eg: Splunk>, Service now, AWS, Microsoft, CyberArk, Jira Software

**Pricing:**

32.75 AUD per asset Subscription based

**Support:**

24/7 for sev 1 cases.

8x5 for sev 2,3, and 4 cases.

**Training:**

Online Videos, on-demand modules, and Webcasts
